Final Project - Stock Trading

CS3050 – Spring 2016

Michael Smith Jr, Jack Carmichael, Reiker Seiffe

To run our program you must provide 3 inputs, a total number of days(int) a r value(int) and a file with the prices at each day, the individual prices must be on separate lines and there must be a new line character after the final number for this program to function correctly. This program will print the results to standard output.

Example command line input:

```
./a.out 10 2 prices.txt
```

Where:

10 -> Number of days

2 -> r value

prices.txt -> file containing prices data
